Projects: -

1- Electricity Billing System –

It is a desktop-based application developed in Java programming language. The project aims at serving the department of electricity by computerizing the billing system. It mainly focuses on the calculation of units during the specified time and the money to be paid at electricity department.

2 - Face Recognition System –

It is developed using OpenCV and Python. The project's main use is in schools, colleges, universities or even in higher departments as an attendance system, i.e., by recognizing the face of a person his/her attendance can be marked. This technology is very successful in recent years.

3 - Netflix Clone –

It is a clone of Netflix with frontend and backend. The UI is similar like Netflix backend is used to create user account and there is also implementation of API's which is used to fetch movie from the database and many more.
